

Performance of Climate Projections for Yukon and Adjacent Northwest Territories, 1991–2020

Astrid Schetselaar,^{1,2} Trevor Andersen¹ and Christopher R. Burn¹

(Received 29 October 2022; accepted in revised form 14 February 2023)

APPENDIX

TABLE A1. Reconstruction relations used for gap filling at the four representative stations. Slope and intercept refer to least-squares regression parameters required to estimate temperature values at representative stations from values at reconstruction stations. The overlap period is the time for which daily temperature data are available for both stations and were used to develop the relations.

Representative Station	Reconstruction Station	Month	Slope	Intercept	R2	Overlap Period
Inuvik A	Fort Good Hope 2	January	0.80	-4.73	0.705	1957–1966

TABLE A2. Kendall- τ coefficients and n for mean annual temperature records for the four representative stations with other stations in Yukon and Mackenzie Valley. Values in the left column under a representative station are for our adjusted ECCC historical records (E τ), while the right column presents values from homogenized records (H τ). $P < 0.05$ in all cases. Results of the paired Student's t-test for equal means (excluding Beaver Creek) are presented at the end of the table. The two-tailed critical t value is 2.145.

TABLE A3. Kendall- τ correlation coefficients and n for total annual precipitation records of the four representative stations with other sites in Yukon and Mackenzie Valley. Values in each left column are for ECCC historical records (E τ), and in the right column for homogenized records (H τ). Values in bold indicate $p < 0.05$. All data records truncated at the end of 2012, 2013, 2007, and 2014 for Whitehorse, Mayo, Inuvik, and Fort Simpson, respectively corresponding to the ends of the homogenized records. Results of the paired Student's t-test for equal means (excluding Beaver Creek) are presented at end of the table. The two-tailed critical t value is 2.145.
